PERSONAL REPORT OF THE PERSON OF THE PERSON

1. Introduction

The Alberta Health and Social Services Disciplines Committee has conducted an annual survey of health and social service employers since 1979. The survey collected information from employers on full-time and part-time permanent personnel, vacant positions, resignations, casual/contract personnel and recruitment difficulties. The present report summarizes workforce data provided by health units as of March 31, 1991. It should be noted that the employer survey, which was designed to capture workforce data from a wide variety of health and social employers, did not cover the full range of professionals employed by health units, particularly those professionals who are employed in small numbers. Dentists, environmental health engineers, environmental health microbiologists, epidemiologists and medical doctors are some of the professional groups employed by health units that were not measured in the 1991 survey, as well as in prior survey years (See note 1 for a more complete list of the occupations not included on the survey forms given to health units prior to 1992).¹

In 1991, health units accounted for 3.7 percent of the health and social service personnel reported in the employer survey. Like many of the other employers surveyed, health units reported a decline (4.3%) in the number of permanent personnel employed from 1990 to 1991. The decline in the number of permanent personnel in health units was due to a drop in the number of part-time staff (6.8%) and to a lesser extent, to a decline in the number of full-time staff (2.2%). This stands in contrast to the hospital sector, which reported a substantial increase in the number of part-time personnel, along with a decline in the number of full-time staff.

Overall, the total number of full-time equivalent positions in health units decreased by 3.9 percent. The reduction in the number of permanent positions from 1990 to 1991 was accompanied by a decrease in the number of vacant positions and in the vacancy rate (3.6% to 2.3%). However, relatively high vacancy rates continued in 1991 for selected occupations, most notably, dental hygienists (10.6%), public health inspectors (8.3%) and speech-language pathologists (8.7%).

The total number of resignations reported by health units increased substantially, causing a marked rise in the turnover rate from 1990 (7.9%) to 1991 (13.5%).

2. Alberta in Review and Future Trends

To place the health unit workforce in context, a brief review of the demographic, social and economic climate of Alberta is provided below.

Demographic and Economic Changes

- Alberta's population grew by 52,000 (2.1%) during the year prior to March 31, 1991, the highest 12 month growth since 1982. Increases during 1990 in both interprovincial migration (9,000), primarily from Ontario, and international migration (13,000) resulted from the more promising economic and employment prospects in Alberta compared to other provinces.
- The annual increase in the size of the labour force (2.7%), due mainly to increased migration to the province, exceeded the growth in employment (1.1%) from March, 1990 to March, 1991. As a result, the seasonally adjusted provincial unemployment rate in March increased from 6.4 percent (1990) to 7.7 percent (1991).
- There was an increase in the number of unemployment insurance claims filed during March by personnel in health and social service occupations from 1990 to 1991. Some of the largest increases in the number of claims occurred for registered nurses/graduate nurses/nurses in training (208 to 485), nursing attendants (295 to 396), social workers (219 to 249), licensed practical nurses (154 to 167), pharmacists (16 to 31) and dietitians/nutritionists (15 to 26).²
- The Canadian economy entered a recession in 1990. Cost containment and improved economic efficiency were some of the general themes throughout most sectors of the province. The provincial government's efforts at budget control continued to limit the growth of public expenditures.

Government Initiatives

- The total provincial operating grant to health units, hospitals and long-term care facilities increased by 3.0 percent as of April 1, 1990.
- In the fall of 1991, Alberta Health initiated the role statements project for acute care, long-term care, public health and mental health services. The project will address a number of issues including service duplication and gaps in service delivery and will involve a critical reassessment and definition of the future roles of health facilities (e.g., health units and hospitals) in the health system.

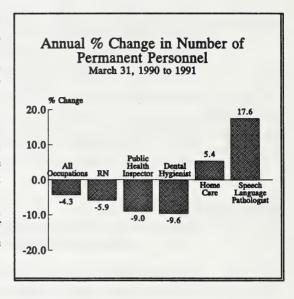

Educational Initiatives

- A collaborative nursing education program with the University of Alberta was implemented at Red Deer College in 1990 and at the five schools of nursing in Edmonton in 1991. In addition to curriculum changes, the collaborative nursing education program improves the integration between the diploma and degree programs by providing students with the opportunity to graduate with either a diploma (after 2 ½ years) or baccalaureate degree (after 4 years).
- The baccalaureate degree in speech-language pathology at the University of Alberta is being discontinued with the last class graduating in May 1993. It is being replaced by a master's degree program to be implemented in September 1992 with a first year enrolment of 30 students.

Future Trends

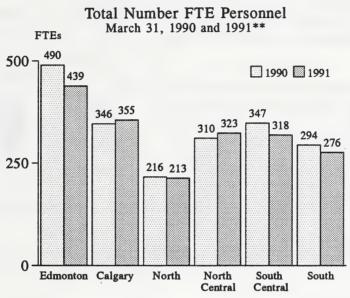

- Increased emphasis on community based as opposed to institutional based patient care will affect the educational preparation and utilization of health and social service personnel.
- Government initiatives like the role statement project may result in a different utilization
 of human resources and a different occupational mix within and between program areas.
- Limited growth in government expenditure is expected to continue and may prompt employers to adopt a number of cost reducing strategies, which could include decreasing the number of employees, shifting from permanent to casual staff, increasing the proportion of part-time personnel and increasing the delegation of duties to the most cost effective personnel trained to perform a given task.
- Changes in the socio-ethnic composition of the population are expected from the increased international migration levels and the aging of the population. Demographic trends indicate by the year 2016, the proportion of the population over the age of 65 will double from approximately 8 percent to 16 percent. The aging of the population, along with a higher proportion of immigrants, will have widespread implications for the demand for health and social services and the types of delivery systems required.
- Educational requirements for employment are predicted to increase. By the year 2000, it is estimated that 64 percent of all new jobs (all employment sectors) will require post-secondary education. In the health and social service sector, professional associations, representing a variety of different occupations, continue to support increasing educational requirements for active registration.

- 3. Permanent Personnel (excluding Leduc-Strathcona and High Level-Fort Vermilion Health Units)³
- The total number of permanent personnel (excluding program administrators and clerical support) employed by health units declined by 4.3 percent, from 2,475 (1990) to 2,369 (1991). Declines were reported in the number of part-time personnel (6.8%) and to a lesser extent in the number of full-time personnel (2.2%).
- The total number of registered nurses dropped by 5.9 percent, from 1,479 to 1,392. There were declines in the number of registered nurses employed part-time (9.2%) as well as full-time (4.0%). The largest decreases were reported in the number of registered nurses working in administration (16.3%) and community/public health (9.4%). The number of registered nurses employed in home care showed the smallest decrease (1.0%). The number of licensed practical nurses and other nursing staff decreased substantially by 64.8 percent, from 71 to 25.

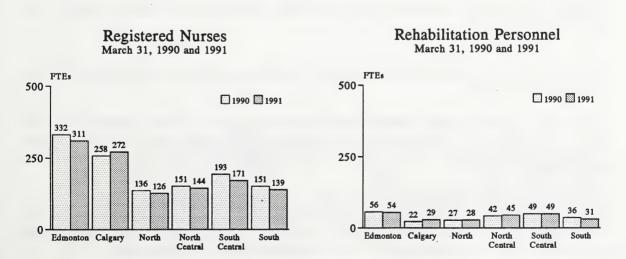

- Decreases in the number of personnel were seen for some of the occupations which had high vacancy rates. Most notably, the number of public health inspectors decreased by 9.0 percent, from 111 to 101 and the number of dental hygienists decreased by 9.6 percent, from 73 to 66. Smaller decreases were reported in the number of occupational therapists (37 to 34) and physical therapists (24 to 19).
- There was a substantial increase (17.6%) in the number of speech-language pathologists (142 to 167). There was no corresponding increase in the number of speech-language pathology assistants/aides (22 to 23).
- The number of home care personnel (homemakers, homehelpers and personal care attendants) increased by 5.4 percent (351 to 370). Smaller increases were reported in the number of nutritionists (18 to 20) and social workers (25 to 30).

Full-time Equivalent Permanent Personnel by Health Unit Association Area Zones March 31, 1990 and 1991*

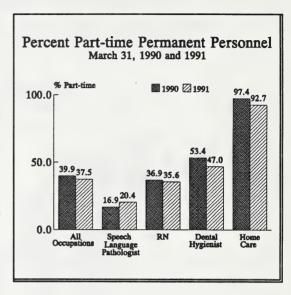

** Excluding program administrators and clerical support personnel.

* Excluding Leduc-Strathcona and High Level-Fort Vermilion Health Units (See Note 3).

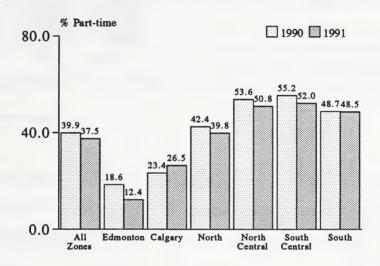

- 4. Percent Permanent Part-time Personnel (excluding Leduc-Strathcona and High Level-Fort Vermilion Health Units)³
- The total percentage of part-time personnel working in health units declined slightly from 39.9 percent (1990) to 37.5 percent (1991).
- Home care personnel (homemakers, homehelpers and personal care attendants) had the highest percentage of part-time staff in 1990 (97.4%) and 1991 (92.7%).
- The percentage of registered nurses employed on a part-time basis dropped slightly from 36.9 percent to 35.6 percent. Registered nurses employed in administration had the lowest percentage of part-time personnel in 1991 (4.9%), while nurses working in home care had the highest proportion (46.2%). The percentage of part-time nurses working in community/public health in 1991 was also quite high (32.6%).

- Relatively high levels of part-time personnel in 1990 and 1991 were reported for dental hygienists (53.4% and 47.0%), physical therapists (66.7% and 63.2%) and occupational therapists (48.6% and 50.0%).
- The proportion of part-time speech-language pathologists increased from 1990 (16.9%) to 1991 (20.4%) but still remained comparatively low.
- Public health inspectors continued to have exceptionally low levels of part-time personnel in 1990 (3.6%) and 1991 (3.0%).
- 5. Casual/Contract/Temporary/Relief Personnel (excluding Leduc-Strathcona and High Level-Fort Vermilion Health Units)³
- The number of casual/contract personnel employed during the month of March decreased from 1990 (315) to 1991 (236), while the average number of hours worked increased from 45.5 to 56.8. In total, the number of casual/contract hours reported for March translated to 108 full-time equivalent positions in 1990 and 112 in 1991.⁴
- Home care personnel (homemakers, homehelpers and personal care attendants) accounted for the majority of the causal/contract staff employed by health units. Although the number of home care personnel working in March declined from 167 (1990) to 111 (1991), there was an increase in the average number of hours worked (40.6 to 55.5). Overall, the number of casual/contract

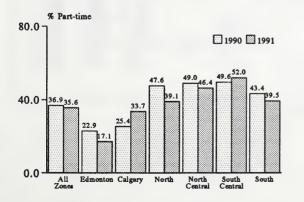

Percent Part-time Permanent Personnel by Health Unit Association Area Zones March 31, 1990 and 1991*

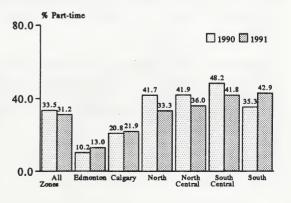

Total Percent Part-time March 31, 1990 and 1991

Registered Nurses March 31, 1990 and 1991

Rehabilitation Personnel March 31, 1990 and 1991

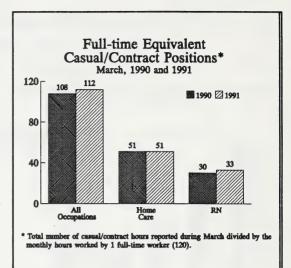

^{*} Excluding Leduc-Strathcona and High Level-Fort Vermilion Health Units (See Note 3).

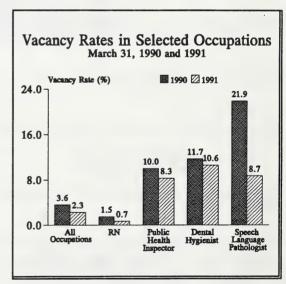

full-time equivalent positions for home care personnel in March remained the same from 1990 (51) to 1991 (51).

- The number of casual/contract registered nurses employed during March declined from 99 to 75, while the average number of hours worked increased from 42.4 to 52.0. The total number of casual/contract hours worked by registered nurses in March translated to 30 full-time equivalent positions in 1990 and 33 in 1991.
- There were comparatively small numbers of casual/contract speech-language pathologists (7), occupational therapists (4) and physical therapists (4) employed during March 1991.

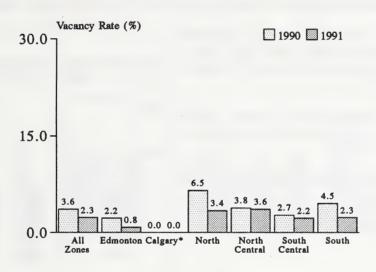

6.0 Vacancy Rates (excluding Leduc-Strathcona, High Level-Fort Vermilion and Calgary Health Units)⁵

- The total number of full-time equivalent vacant positions reported by health units declined from 78 (1990) to 49 (1991). The vacancy rate dropped from 3.6 percent to 2.3 percent.
- The number of full-time equivalent vacant positions for registered nurses declined from 14 (1990) to 6 (1991). The were small numbers of vacant positions in 1990 and 1991 for nurses in administration (2 and 0), community/public health (7 and 5) and home care (6 and 1). The overall vacancy rate for registered nurses continued to be very low in 1990 (1.5%) and 1991 (0.7%).
- Relatively high numbers of vacant full-time equivalent positions in 1991 were reported for speech-language pathologists (12), public health inspectors (7), dental hygienists (6), physical therapists (6) and occupational therapists (5).

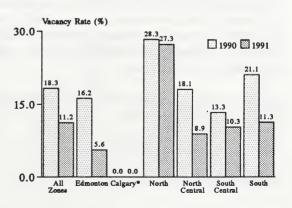

Vacancy Rates by Health Unit Association Area Zones March 31, 1990 and 1991*

All Permanent Personnel Combined March 31, 1990 and 1991

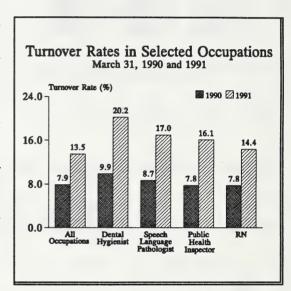

Registered Nurses March 31, 1990 and 1991

Rehabilitation Personnel March 31, 1990 and 1991

^{*} Excluding Leduc-Strathcona, High Level-Fort Vermilion and Calgary Health Units (See Note 5).

- 7. Three Month Vacant Positions (excluding Leduc-Strathcona, High Level-Fort Vermilion and Calgary Health Units)⁵
- The number of positions vacant for three months or longer on March 31 declined from 47 (1990) to 32 (1991). The highest numbers of three month vacancies in 1991 were reported for speech-language pathologists (12), public health inspectors (6), dental hygienists (4) and physical therapists (4).
- 8. Turnover Rates (excluding Leduc-Strathcona, High Level-Fort Vermilion and Calgary Health Units)⁵
- The number of full-time equivalent resignations increased substantially from 169 (1990) to 287 (1991). The corresponding turnover rate rose from 7.9 percent to 13.5 percent.
- The number of resignations by registered nurses increased from 75 to 128. The turnover rate rose from 7.8 percent to 14.4 percent.
- Some of the largest increases in the number of fulltime equivalent resignations from 1990 to 1991 occurred for speech-language pathologists (13 to 24), public health inspectors (7 to 14) and dental hygienists (6 to 11).

9. Further Information

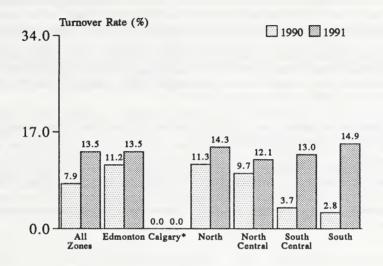

Questions regarding the methodology or the data supplied in this report can be addressed to the Alberta Health and Social Services Disciplines Committee. In addition, individuals or organizations may request supplemental information and analyses specific to their needs. It should be noted that the Alberta Health and Social Services Disciplines Committee is able to release information on aggregate data only; data on individual employers is confidential and may only be released to the reporting employer. For further information, please contact:

Alberta Health and Social Service Disciplines Committee 5th Floor, Kensington Place 10011-109 Street EDMONTON, Alberta T5J 3S8

Telephone: (403)427-2655

^{*} Excluding Leduc-Strathcona, High Level-Fort Vermilion and Calgary Health Units (See Note 5).

Notes

- ¹ The 1991 survey, as well as prior surveys, did not collect information on personnel employed in following occupations: dentists, environmental health engineers, environmental health microbiologists, RN-sexual health, RN-mental health, MD-generalist, MD-specialist, MD/MPH (masters degree in public health), child/youth care personnel, epidemiologists, adult educators, sexuality/sexual health professionals, early intervention professionals, genetic associates, community development professionals and public communications personnel. These occupations were added to the 1992 survey of health units.
- ² The data on unemployment insurance claimants was supplied by the Alberta Bureau of Statistics and refers to regular active claimants during March, 1990 and March, 1991 only. Regular active claimants include those claimants on lay-off; those who have voluntarily left their jobs and are looking for work; those who are part-time workers; those who are trainees covered by job-sharing or job creation agreements. It is important to note that the characteristics of the unemployment insurance claimant population cannot be interpreted as the characteristics of all unemployed persons as described by Statistics Canada's Labour Force Survey.
- ³ The Leduc-Strathcona Health Unit was unable to respond to the 1990 employer survey and the High Level-Fort Vermilion Health Unit was unable to supply data for the 1991 survey. To allow for valid comparisons from 1990 to 1991, the data from these health units has been omitted from the figures presented in the text and graphics. The complete data set for 1991 (which includes the data supplied by Leduc-Strathcona in 1991) is given in the Appendices.
- ⁴ Full-time equivalent casual/contract positions are calculated by dividing the total number of casual/contract hours reported during March by the monthly hours worked by 1 full-time worker (120).
- ⁵ The Leduc-Strathcona Health Unit and Calgary Health Services were unable to supply vacancy and resignation data for the 1990 employer survey and the High Level-Fort Vermilion Health Unit was unable to supply data for the 1991 survey. To allow for valid comparisons from 1990 to 1991, the data from these health units has been omitted from the figures presented in the text and graphics. The complete data set for 1991 (which includes the data supplied by Leduc-Strathcona and Calgary Health Services) is given in the Appendices.

APPENDIX 1. METHODOLOGY

The Alberta Health and Social Services Disciplines Committee has conducted a mail-out survey of employers in the health and social service sector in the province since 1979. These surveys were mailed during the month of March each year and were formatted into three main sections.

SECTION A collected information on full-time and part-time permanent personnel employed on March 31, full-time and part-time vacancies on March 31, and full-time and part-time resignations occurring during the year prior to March 31.

SECTION B requested information on casual, contract, temporary and relief personnel employed during the month of March. For each occupation listed on the survey form, employers were requested to indicate the total number of casual/contract personnel and the total number casual/contract hours worked by these personnel during the month of March.¹

SECTION C collected information on employer recruitment difficulties. In the first part of this section, employers were asked to indicate the number of full-time and part-time vacant positions reported in Section A that had been vacant three months or longer while recruitment activities had been in progress. In the second part, employers were requested to list the occupations for which they anticipated recruitment problems in the next year and the reasons for the anticipated staffing difficulty.

Employers were instructed to apply the following definitions when completing the survey:

Personnel employed: all individuals employed by your organization on a regular or part-time

basis.

Full-time: thirty hours or more per week.

Part-time: less than thirty hours per week.

Vacancies: positions for which personnel are actively being recruited as of March 31.

Resignations: individuals who terminated employment during the one year period from

April 1 to March 31. Do not include persons who have been promoted or

transferred.

Casual, Temporary, Contract, or Relief

individuals who worked on-call, relief, or on a temporary basis and did not fill a regular full-time

Personnel: and/or part-time position. These individuals were paid directly through your

organization or through an outside agency.

¹ The occupations for which casual/contract data was sought were explicitly listed on the survey form. The occupations listed on the form included registered nurses, licensed practical nurses, physical therapists, occupational therapists, psychologists, social workers, dietitians/nutritionists, pharmacists, audiologists/speech pathologists, and dental hygienists.

All health units in the province were included in the annual employer survey. Response rates from health units to the survey have generally been excellent. In 1990, all but one health unit (Leduc-Strathcona) was able to provide workforce data. In the 1991 survey there was again only one non-response (High Level-Fort Vermilion). Calgary Health Services was not able to supply data on vacancies or resignations in the 1990 survey.

APPENDIX 2. HEALTH UNIT ASSOCIATION OF ALBERTA "ZONES"

The Health Unit Association of Alberta groups the 27 health units into six geographical zones. The health units included in each of these zones are given below.
